Our Rehabilitation approach

The Benefits of Land Physical Therapy for Pets

Restores Mobility & Gait

Corrects compensatory movement patterns early, before they cause lasting damage to other joints.

Prevents Muscle Atrophy

Keeps muscles strong during recovery so your pet heals faster and re-injury risk drops significantly.

Reduces Pain Naturally

Therapeutic movement triggers endorphins and anti-inflammatory pathways — no drugs needed.

Improves Quality of Life

Pets that move freely are happier. Rehab restores not just mobility — but joy.

CONDITIONS WE TREAT

Who Benefits from Land Rehab?

If your pet is dealing with any of the following, land physical therapy can help them feel like themselves again.

Post-TPLO & Cruciate Surgery

Back to zoomies faster with targeted strength & gait work.

Hip & Elbow Dysplasia

Muscle-building exercises take load off painful joints.

IVDD & Spinal Cord Injury

Neurological rehab helps rewire the body's

Degenerative Myelopathy

Slows progression and preserves function

IVDD & Spinal Cord Injury

Neurological rehab helps rewire the body's movement signals.

Degenerative Myelopathy

Slows progression and preserves function for longer.

Osteoarthritis & Spondylosis

Gentle movement is one of the best long-term pain relievers.

Fracture Recovery

Safe, progressive loading rebuilds bone and muscle together.

Muscle Atrophy & Weakness

Targeted exercise restores mass and strength limb by limb.

Neurological Conditions

E-stim and sensory work retrain nerves that injury has quieted.

Obesity & Weight Management

Low-impact exercise burns calories without stressing fragile joints.

Soft Tissue Injuries

Guided rehab heals sprains and strains without re-injury risk.

Chronic Lameness

Gait retraining corrects the limp and the compensations causing it.

Senior Pet Fitness

Aging doesn't have to mean slowing down — keep golden years golden.

Moving Again. Living Again.

★★★★★

"Ranger couldn't use his back legs at all after his IVDD episode. Between the physical therapy exercises and the e-stim, he was walking on his own within three weeks. The team at Healing Paws is simply extraordinary."

— Carlos M., German Shepherd dad · Fort Lauderdale

★★★★★

"We were told Luna would always limp after her TPLO. The land rehab program here proved that wrong completely. She runs on the beach like nothing ever happened."

— Priya K., Golden Retriever mom · Plantation

Your Questions, Answered

How is veterinary physical therapy different from just walking my dog?

Regular walks engage muscles generally and maintain baseline fitness, but they cannot target specific muscle groups, retrain faulty movement patterns, or address neurological deficits.

Veterinary physical therapy uses precise exercises, specialized equipment, and hands-on guidance to produce therapeutic outcomes that casual exercise simply cannot replicate — especially after surgery or injury.

When can my pet start physical therapy after surgery?

In most cases, passive range of motion and gentle massage can begin within 24–48 hours post-surgery. Active therapeutic exercises typically begin within the first week, depending on the procedure. Starting early is almost always better — it's the single most impactful thing you can do to shorten recovery. We work in close coordination with your surgeon to time everything appropriately.

Will my pet tolerate the exercises?

Most pets adapt quickly and many genuinely enjoy their sessions — the one-on-one attention, gentle handling, and positive reinforcement (WE LOVE USING TREATS!!) make rehab a positive experience.

Our team is experienced in reading animal behavior and always works within each pet's comfort level.

Sessions are never forced, and pace is always tailored to the individual.

Can physical therapy be combined with underwater treadmill or laser therapy?

Yes — and combination programs are often the most effective. Laser therapy reduces inflammation and pain before or after a land session; the underwater treadmill builds cardiovascular fitness and muscle mass while land exercises focus on precision movement, balance, and neurological retraining. Your holistic vet will design the ideal combination protocol for your pet's specific condition.

How do I know if my pet needs physical therapy?

Signs include limping or uneven gait, reluctance to use stairs or jump, muscle loss in one or more limbs, stiffness after rest, decreased activity level, or any recent surgery or neurological event. If you're unsure, a free

consultation with our team is the best first step — we'll give you an honest assessment of whether rehabilitation would benefit your pet.
